

Forecast at Home: Automated Weather Alert

Forecast at Home is a screen-free weather alert system for your home.

Installed by a door, F@H sends out a sound and light signal indicating the current weather forecast.

How it Works:

When F@H detects your presence as you approach, the device makes a call to the Yahoo API, parses and then maps the weather code to an appropriate sound and light indication.

Darker colors indicate gloomy weather, lighter colors sunny and clear skies. Rainy? "Bring an umbrella!" Chilly? "Bundle up!"
